

Zone of Theoretical Visibility - 45km

TO BLADE TIP HEIGHT WITH VIEWPOINTS: 45KM RADIUS

In terms of potential visual effects, the preliminary Zone of Theoretical Visibility (based on the 16 turbine layout and blade tip height) illustrates that theoretical visibility would generally be focused within 0 - 10km, becoming increasingly fragmented beyond this distance due to the surrounding topography.

The viewpoint locations identified below will have visualisations (comprising existing view and wireframe, as well as photomontage for viewpoints located within 25km where significant effects are likely to result) prepared to illustrate the potential magnitude of change at the agreed viewpoint locations. We will work with NatureScot to ensure that all visualisation images where significant effects are assessed are prepared in accordance with the Visual representation of Wind Farms, Version 2.1. (NatureScot (formerly known as Scottish Natural Heritage) 2014).
