

# Landscapes and Visual - Wider Context

## ZTV

We have finalised a Zone of Theoretical Visibility Model (which can be seen in full on the separate sheet. This is based on a bare ground model of topography and does not account for trees, vegetation or buildings screening views. The main conclusions are:

- There are very few to no visual impacts to the north and west
- Impacts are predicted to be concentrated to the south and east, and therefore this is where we have concentrated our Viewpoint selection to prepare photomontages from. These are generally contained within around 10km, with impacts beyond that becoming more sporadic

We used this ZTV to inform the detailed viewpoint assessment which will be reported within the EIA.

Further detail is available within the rest of this information pack, including some draft photomontages, and visual aids to demonstrate impact.
